

Pollen morphology of the genus *Verbascum* L. (Group A) in Turkey

Sevil PEHLİVAN¹, Birol BASER *¹, Faik A. KARAVELİOĞULLARI¹

¹Gazi University Science and Art Faculty Department of Biology Teknikokullar, 06500 Ankara, Turkey

Abstract

Pollen morphology of 30 taxa belonging to *Verbascum* L. of the family Scrophulariaceae from Turkey has been investigated using light microscope and scanning microscope. It is an eurypalynous family Erdtman (1952). Pollen grains usually radially symmetrical, isopolar, oblate-spheroidal to spheroidal, tricolporate. Tectum reticulate and coarsely reticulate.

Keywords: *Verbascum*, Pollen, Turkey

Özet

Scrophulariaceae familyasından Türkiye'de yayılış gösteren *Verbascum* L. cinsine ait 30 taksonun polen morfolojisi, ışık ve elektron mikroskopu kullanılarak çalışılmıştır. Scrophulariaceae eurypalynous bir familyadır Erdtman (1952). Polen taneleri genellikle radyal simetrisi, isopolar, oblate-spheroidal'den spheroidal, tricolporate'a kadar. Tectum reticulate ve kabaca reticulate.

Anahtar Kelimeler: *Verbascum*, Polen, Türkiye

1. Introduction

This family is represented by 280 genera and about 3000 species in the world and 30 genera and 466 species in Turkey (Watson & Dallwitz, 1991; Huber-Morath, 1978). *Verbascum* is represented by 360 taxa in the world and 241 taxa in Turkey (Huber--Morath 1978, Davis *et al.* 1988, Vural & Aydoğdu 1993, Karavelioğulları *et al.* 2004, 2006,

* Corresponding author / Haberleşmeden sorumlu yazar: baser@gazi.edu.tr

2008, Sutorý 2001, 2004 Özhatay 2006, Kaynak *et al.* 2006, Parolly, G. & Tan, K. 2007, 2008). *Verbascum* group A, is could be separated with having 4 stamens from the others groups. This group members are represented by 45 taxa in Turkey and others neighbouring countries (Ferguson, 1972; Fedchenko, 1955; Huber-Morath, 1981; Feinbrun-Dothan, 1978a, 1978b; Meikle, 1985; Täckholm, 1974).

Pollen morphology of the family Scrophulariaceae has been examined by a number of workers such a Erdtman (1952), Moore & Webb (1978), Inceoglu (1982), Vargehese (1986), Argue (1986) Karim & EL-Oqlah (1989), Minki & Eshbaugh (1989), Karavelioğulları *et al.*, (2005)

2. Materials and methods

Material used for study was collected from 30 wild populations in Turkey which belong to 30 taxa in 28 species. Collectors and localities are shown in the Appendix. The list of voucher specimens of the plants are deposited in the herbarium of GAZI. The pollen grains were prepared for light (LM) by the standard methods described by Erdtman (1952). For light microscopy, the pollen grains were mounted in unstained glycerine jelly and observations were made with a Prior microscope under (125, 0.65) and oil immersion (E100, 1.25), using 10x eye piece. For scanning electron microscopy investigations, the polen grains were put on stubs, stutter-coated with gold plate. The S.E.M examination was carried out on a Jeol microscope JSM-6060. The measurements were based on 30 readings from each specimen. Polar axis, equatorial diameter, P/E ratio, exine, colpi long axis, colpi short axis, apocolpium and Amb diameter were also measured. The terminology used is in accordance with Erdtman (1952), Kremp (1965), Faegri & Iversen (1964), Walker & Doyle (1976) and Willis (1973).

3. Results

3.1. General pollen characters of the genus Verbascum (Group A)

Verbascum natolicum (Fisch. & C.A.Mey.) Hub.-Mor. Figure. 1. A, B, Table 1.

Measurements: Polar axis P (22.56–) 23.44±0.90 (–26.04) µm, and equatorial diameter E (18.22–) 20.35±1.57 (–22.56) µm, P/E ratio: 1.15. Colpi (16.49–) 19.82±2.05 (–23.43) µm long. Amb diameter (21.70–) 23.14±1.27 (–26.04) µm. Apocolpium (1.73–) 2.79±0.65 (–4.34) µm. Exine (0.86–) 1.01±0.17 (–1.73) µm thick, ornamentation is coarsely reticulate.

Verbascum spodiotoricum (Hub.-Mor) Hub.-Mor. Figure. 2. A, B, Table 1.

Measurements: Polar axis P (14.75–) 16.23±0.83 (–17.36) µm, and equatorial diameter E (12.15–) 14.20±1.17 (–15.62) µm, P/E ratio: 1.14. Colpi (11.45–) 13.37±1.17 (14.75) µm long. Amb diameter (13.88–) 14.52±0.60 (–15.62) µm. Apocolpium (1.73–) 2.09±0.38 (–2.60) µm. Exine (0.86–) 0.94±0.11 (–1.08) µm thick, ornamentation is reticulate.

Verbascum orientale (L.) All. Figure. 3. A, B, Table 1.

Measurements: Polar axis P (27.77–) 29.97±1.56 (–33.85) µm, and equatorial diameter E (24.30–) 27.28±1.81 (–32.94) µm, P/E ratio: 1.10. Colpi (19.96–) 25.43±2.22 (–29.51) µm long. Amb diameter (25.17–) 27.11±1.42 (–29.51) µm. Apocolpium (3.47–) 5.09±0.73 (–6.07) µm. Exine (1.30–) 1.47±0.21 (–1.73) µm thick, ornamentation is reticulate.

Verbascum brachysepalum (Fisch. & Trautv.) O. Kuntze Figure. 4. A, B, Table 1.

Measurements: Polar axis P (24.30–) 25.87±1.30 (–28.64) µm, and equatorial diameter E (21.70–) 23.63±1.09 (–25.17) µm, P/E ratio: 1.09. Colpi (19.96–) 22.48±1.71 (–26.04) µm long. Amb diameter (23.43–) 25.84±1.56 (–28.64) µm. Apocolpium (2.60–) 3.64±0.70 (–4.34) µm. Exine (0.86–) 0.97±0.11 (–1.08) µm thick, ornamentation is reticulate.

Verbascum cilicum (Boiss. & Heldr.) O. Kuntze Figure. 5. A, B, Table 1.

Measurements: Polar axis P (19.96–) 22.54±1.13 (–24.30) µm, and equatorial diameter E (18.2–) 20.39±1.14 (–22.56) µm, P/E ratio: 1.11. Colpi (15.62–) 17.70±1.55 (–19.96) µm long. Amb diameter (18.22–) 19.75±0.96 (–20.83) µm. Apocolpium (1.73–) 2.47±0.30 (–2.60) µm. Exine (0.86–) 0.94±0.10 (–1.08) µm thick, ornamentation is coarsely reticulate.

Verbascum flabellifolium (Hub.-Mor.) Hub.-Mor. Figure. 6. A, B, Table 1.

Measurements: Polar axis P (20.83–) 22.85±1.35 (–25.17) µm, and equatorial diameter E (17.36–) 20.19±1.04 (–22.56) µm, P/E ratio: 1.11. Colpi (16.49–) 19.76±1.47 (–22.56) µm long. Amb diameter (19.96–) 21.35±0.34 (–22.56) µm. Apocolpium (1.73–) 2.34±0.38 (–2.60) µm. Exine (0.65–) 0.90±0.14 (–1.08) µm thick, ornamentation is reticulate.

Verbascum trapifolium (Stapf.) Hub.-Mor. Figure. 7. A, B, Table 1.

Measurements: Polar axis P (18.22–) 22.74±0.73 (–22.56) µm, and equatorial diameter E (16.49–) 20.54±1.05 (–20.83) µm, P/E ratio: 1.11. Colpi (15.62–) 19.44±1.12 (–21.70) µm long. Amb diameter (17.4–) 21.01±1.06 (–19.96) µm. Apocolpium (2.60–) 3.73±0.70 (–3.90) µm. Exine (0.86–) 0.96±0.11 (–1.08) µm thick, ornamentation is coarsely reticulate.

Verbascum pyroliforme (Boiss. & Heldr.) O. Kuntze Figure. 8.A, B, Table 1.

Measurements: Polar axis P (21.70–) 23.89±1.52 (–26.04) µm, and equatorial diameter E (18.22–) 20.62±1.13 (–21.70) µm, P/E ratio: 1.16. Colpi (16.49–) 20.16±1.47 (–23.43) µm long. Amb diameter (18.2–) 21.78±1.37 (–23.4) µm. Apocolpium (1.73–) 1.97±0.36 (–2.60) µm. Exine (0.65–) 0.81±0.08 (–0.86) µm thick, ornamentation is reticulate.

Verbascum dudleyanum (Hub.-Mor.) Hub.-Mor. Figure. 9. A, B, Table 1.

Measurements: Polar axis P (15.6–) 21.57±1.30 (– 22.56) µm, and equatorial diameter E(13.88–) 20.19±0.99 (–19.96) µm, P/E ratio: 1.03. Colpi (12.15–) 18.14±1.39 (–19.96) µm long. Amb diameter (16.49–) 20.63±0.75 (–19.96) µm. Apocolpium (1.73–) 2.80±0.22 (–3.47) µm. Exine (0.65–) 0.86±0.22 (–1.08) µm thick, ornamentation is reticulate.

Verbascum coronopifolium (Boiss. & Balansae) O. Kuntze Figure. 10.A, B, Table 1.

Measurements: Polar axis P (19.96–) 24.38±2.14 (–26.04) µm, and equatorial diameter E (17.36–) 19.21±1.04 (–20.83) µm, P/E ratio: 1.27. Colpi (15.62–) 17.13±0.85 (–18.22) µm long. Amb diameter (17.36–) 19.73±1.14 (–21.70) µm. Apocolpium (2.60–) 3.98±0.60 (–4.34) µm. Exine (0.65–) 0.80±0.09 (–0.86) µm thick, ornamentation is reticulate.

Verbascum serratifolium (Hub.-Mor.) Hub.-Mor. Figure. 11.A, B, Table 1.

Measurements: Polar axis P (19.96–) 22.07±1.08 (–23.40) µm, and equatorial diameter E(18.22–) 20.50±1.50 (22.56) µm, P/E ratio: 1.08. Colpi (16.49–) 18.19±1.10 (19.96) µm long.. Apocolpium (2.60–) 3.80±0.68 (–5.20) µm. Amb diameter(16.49–) 20.02±1.08(–22.56) µm. Exine (0.86–) 0.93±0.10 (–1.08) µm thick, ornamentation is coarsely reticulate.

Verbascum basivelatum Hub.-Mor. Figure. 12.A, B, Table 1.

Verbascum transcaucasicum Wulf. Figure. 30. A, B, Table 1.

Measurements: Polar axis P (17.36–) 20.36±1.80 (–22.56) µm, and equatorial diameter E (13.88–) 17.78±1.77 (–19.96) µm, P/E ratio: 1.15. Colpi (15.62–) 16.95±0.74 (–18.22) µm long. Amb diameter (17.36–) 18.13±0.69 (–19.09) µm. Apocolpium (1.73–) 2.31±0.41 (–3.03) µm. Exine (0.65–) 0.74±0.11 (–0.86) µm thick, ornamentation is reticulate.

3.2. Key to the species

- 1- Pollen shape oblate *V. suworowianum* var. *suvorowianum*
- 1- Pollen shape prolate, subprolate
- 2- Pollen shape subprolate
- 3-Exine diameter 0.79 to 0.86 μ m
- 4- Polar axis 21 μ m
- 5- Colpi short axis 2 μ m..... *V. oreophilum* var. *joannis*
- 5- Colpi short axis 4 μ m..... *V. levanticum*
- 4- Polar axis 23 to 24 μ m
- 6- Colpi long axis 17 μ m..... *V. coronopifolium*
- 6- Colpi long axis 20 μ m..... *V. pyroliforme*
- 3- Exine diameter 1 μ m
- 7- Amb diameter 16 μ m..... *V. rupicola*
- 7- Amb diameter 23 μ m..... *V. natolicum*
- 2- Pollen shape prolate
- 8- Polar axis 16 to 19 μ m
- 9- Equatorial diameter 14 μ m..... *V. spodiotrichum*
- 9- Equatorial diameter 16 to 20 μ m
- 10- Colpi short axis 2 μ m..... *V. ponticum*
- 10- Colpi short axis 3 to 4.5 μ m
- 11- Exine diameter 1 μ m..... *V. gaillardotii*
- 11- Exine diameter 0.6 to 0.9 μ m
- 12- Amb diameter 17 μ m
- 13- Apocolpium 1 to 2 μ m
- 14- Colpi short axis 3.66 μ m..... *V. luciliae*
- 14- Colpi short axis 3.85 μ m
- *V. agrimoniiifolium* ssp. *agrimoniifolium*
- 13- Apocolpium 3 μ m..... *V. bugifolium*
- 12- Amb diameter 18 μ m
- 15- Colpi short axis 3 μ m..... *V. basivelatum*
- 15- Colpi short axis 4 μ m..... *V. bormmuellerianum*
- 8- Polar axis 20 to 29 μ m
- 16- Amb diameter 18 to 20 μ m
- 17- Colpi short axis 2 to 3 μ m
- 18- Colpi long axis 16 μ m..... *V. transcaucasicum*
- 18- Colpi long axis 18 μ m..... *V. borgeauanum* and *V. dudleyanum*
- 17- Colpi short axis 4 to 5 μ m
- 19- Colpi long axis 17 μ m
- 20- Apocolpium 3 μ m..... *V. nudicaule*
- 20- Apocolpium 2 μ m
- 21- Polar axis 21 μ m..... *V. suworowianum* var. *pilosus*
- 21- Polar axis 22 μ m..... *V. cilicum*
- 19- Colpi long axis 18 μ m..... *V. sorgerae*
- 16- Amb diameter 21 to 27 μ m
- 22- Polar axis 21 μ m
- 23- Colpi long axis 17 μ m
- 24- Apocolpium 2 μ m..... *V. oreophilum* var. *oreophilum*
- 24- Apocolpium 3 μ m..... *V. freynii*
- 23- Colpi long axis 18 to 19 μ m
- 25- Apocolpium 2 μ m
- 26- Exine diameter 0.86 μ m..... *V. serpenticola*
- 26- Exine diameter 1 μ m..... *V. flabellifolium*
- 25- Apocolpium 3 μ m
- 27- Colpi long axis 18 μ m..... *V. serratifolium*
- 27- Colpi long axis 19 μ m..... *V. trapifolium*
- 22- Polar axis 25 to 29 μ m
- 28- Exine diameter 0.97 μ m..... *V. brachycephalum*
- 28- Exine diameter 1.47 μ m..... *V. orientale*

4. Results and discussion

The Scrophulariaceae is a more or less stenopalynous family Erdtman, (1952). When examined under the light microscope (Table 1) the taxa of *Verbascum* show a more or less uniform pattern of the pollen morphology. At first sight it seems that the pollen characters in this family are of little value for taxonomic studies.

The morphological characteristics of the pollen grains of 30 taxa of *Verbascum* (group A) are shown in Table I. The pollen of all species is radially symmetrical, isopolar, tri-colporate, zonoaperturate, prolate or subprolate, oblate spheroidal in shape and in the P/E ratio (polar axis / equatorial axis), ectoaperture – colpus long, narrow, not sunken Erdtman, (1952). The size of the pollen grains ranged from 16.23-29.97 µm min length (polar axis), 14.20-27.28 µm in width (equatorial axis), P/E ratio 0.99-1.27, colpi long axis 13.37-25.43 µm, colpi short axis 2.39-5.81 µm, apocolpium 1.97-5.09 µm, Amb diameter 14.52-27.11 µm. Exine thickness from 0.65-1.47 µm. Examination of the exine surface of all the species under the SEM gave very good diagnostic characters. Two sculptures of exine showed very good diagnostic characters for separating the taxa into groups based on the sculpturing type: reticulate and coarsely reticulate.

In our study, some remarkable dimensional differences were observed between taxa. Polar axis of *V. spodiotrichum* is the smallest (16.23 µm), *V. orientale* is the largest (29.97 µm). Equatorial diameter of *V. spodiotrichum* is the smallest

(14.20 µm), *V. orientale* is the largest (27.28 µm). Exine of *V. luciliae* is the smallest (0.65 µm), *V. orientale* is the largest (1.47 µm). Colpi long axis of *V. spodiotorichum* is the smallest (13.37 µm), *V. orientale* is the largest (25.43 µm). Colpi short axis of *V. transcaucasicum* is the smallest (2.39 µm), *V. natolicum* is the largest (5.81 µm). Apocolpium of *V. levanticum* and *V. pyroliforme* is the smallest (1.97 µm), *V. orientale* is the largest (5.09 µm). Amb diameter of *V. spodiotorichum* is the smallest (14.52 µm), *V. orientale* is the largest (27.11 µm). *V. orientale* and *V. brachcephalum* is only colpal membrane densely granulated.

In Flora of Turkey, these two species were separated from each other as follows;

1. Pedicel thickness, equal or shorter than capsule *V. orientale*
1. Pedicel weak, 2-3 times longer than capsule.....*V. brachysepalum*

Also, these two taxa have some differences in their description in the Flora of Turkey. These are lower bract pinnatisect, upper bracts linear corolla with brown spots inside in *V. orientale*. Bracts oblong-linear, linear; corolla without spots inside in *V. brachysepalum*.

As a result of the field studies and investigations on herbaria materials it seen that, the using corolla having brown inside, is not a good character. The specimen of *V. orientale* (FAK 3260) collected from Erzurum had no brown spots and the specimen of *V. brachysepalum* collected from Mersin (FAK 3185) had a few obscur brown spots inside the corolla (Karavelioğulları & Aytaç 2008).

Using other charachters, length of pedicels and structure of bracts. In *V. orientale*, pedicels are 1.5-5 mm long, and lower bracts are pinnatisect; pedicels are 8-20 mm and all bracts oblong-linear to linear in *V. brachysepalum*. Only upper bracts are linear in *V. orientale* (Karavelioğulları & Aytaç 2008).

The morphological characteristics of the pollen grains *Verbascum suworowianum* var. *suworowianum* is oblate, *Verbascum suworowianum* var. *papillosum* is prolate.

These two variaties are growing same area, the basal leaves very important for separation. Otherwise stem hairness is not good charachters, to given in Flora of Turkey, because two of them have glandulare and aglandular hairs.

The morphological characteristics of the pollen grains *V.oreophilum* var. *joannis* is subprolate, *V. oreophilum* var. *oreophilum* is prolate.

In Flora of Turkey, these two species were separated from each other as follows;

1. Filaments with purplish-violet hairy; inflorescence stellate-short stalked glandular hairy.....var. *oreophilum*
1. Filaments with whitish-yellow hairy; inflorescence stellate-eglandular hairyvar. *joannis*

Showed in key to the species *V. borgeauanum* and *V. dudleyanum* the morphological characteristics of the pollen grains is similar but In Flora of Turkey, these two species is different. *V. borgeauanum* is filament with whitish-yellow hairs up to anthers. *V. dudleyanum* is filament with whitish-yellow wool 2 anterior anthers glabrous near apex

The determination of the taxa pollen morphological structure in the results has led us to think better of the usefulness of pollen studies in distinguishing the characteristics possessed by the taxa.

Acknowledgements

The authors thank to Curators of Herbaria AEF, ANK, EGE, GAZI, HUB, ISTF, ISTE, KNYA, VANF G, GB, P, K, B and E who allowed us to study their *Verbascum* specimens, to Karel Sutorý for sending of some papers, to Dr. Hakan Güngüneş who is helper to take of electron photographs of pollen and seed surface, Turkish Military Army for their help during our fieldwork and we are grateful to Ahmet Yavru for here help.
